Found section interests: interests are game development and artificial intelligence, both of which allow me to project my creativity in their respective field. i am also very eager to learn new aspects of other computer science areas and also broaden my knowledge of my existing fields. currently, for my bachelor's thesis, i'm implementing chunk based procedural generation using the unity game engine and combining that with my ai knowledge to create smart enemies, that adapt to the player's behavior. following this, i am planning to follow a masters degree in graphics, multimedia and virtual reality at faculty of automatic control and computer science.

Found section education: education • bachelor's degree at the faculty of mathematics and informatics (2020 - 2024) being in the computers and information technology department, i have acquired multiple

Found section skills: skills regarding different computer science related subjects such as: object oriented programming, data structures and artificial intelligence.

• extracurricular courses during my time at crazy badgers i have followed udemy courses that allowed me to gain skills with using django and wagtail for back-end and introduced me to react for front-end. additionally, i have followed a unity game engine course at game dev academy, which introduced me to the basics of how to navigate and use the engine, creating a solid base for me to build up on to this day. • extracurriculars • hackathons and game jams i have participated in two natural language processing hackathons organized by nitro language processing in which i developed machine learning based models created from scratch or implemented the bert model. additionally, by participating in a hackathon organized by zenko ai, i was given the opportunity to work with the openai api and learn how to use it in order to implement a virtual assistant for a festival. regarding game jams, i have participated in 5+ competitions in which i was able to develop games based on the theme and learn new techniques and features for the unity engine. • overtime (learn.build.play competition - organized by rgda) with the competition spanning for 4 months, me and 3 of my friends formed a team to develop overtime in the unity engine using c#. our teamwork and project planning allowed us to compete with the other 70 teams and earn ourselves the 3rd place prize. • web scraper for downloading pdfs in order to solve a personal problem, i have developed a web scraper using python to iterate through the pages of a site and create requests to scrape all of the images needed. with said images, the program would merge them into batches and create pdfs to store them locally. work

Found section experience: experience • crazy badgers (july - december 2022) working as a full-stack developer has allowed me to create fully functional sites from scratch using python with frameworks such as django and wagtail for back-end, and react for front-end. furthermore, this experience has allowed me to deepen my understanding of working with a team, managing tasks and communicating with clients.
